

teacher: How do Fungi get nutrition?

student_low_response: "Fungi can make their own food, like plants, by using photosynthesis to make sunlight into energy."

teacher: How do Fungi get nutrition?

student_low_response: "Fungi have special structures called chloroplasts that allow them to carry out photosynthesis and produce their own food."

teacher: How do Fungi get nutrition?

student_low_response: "Like green plants, fungi have chlorophyll, which helps them absorb sunlight and make nutrients through photosynthesis."

teacher: How do Fungi get nutrition?

student_medium_response: "Fungi get nutrition from live organic material."

teacher: How do Fungi get nutrition?

student_medium_response: "Fungi get vital nutrients from dying inorganic material."

teacher: How do Fungi get nutrition?

student_high_response: "Fungi eat dead organic material to digest it and then release the energy into the environment."

teacher: How do Fungi get nutrition?

student_high_response: "It eats dead organisms."

teacher: How do Fungi get nutrition?

student_high_response: "Yes, but it eats dead- it eats the dead organisms."

teacher: How do Fungi get nutrition?

student_medium_response: "Um, he kept saying that mushrooms are living organisms and like they don't feed on dead organisms, or something like that."

teacher: How do Fungi get nutrition?

student_low_response: "No, it's something they do. Photosynthesis."

teacher: How do Fungi get nutrition?

student_medium_response: "I don't know, they eat bacteria."

teacher: How do Fungi reproduce?

student_medium_response: "I'm pretty sure it's binary fission, because remember when we did all that bacteria stuff."

teacher: How do Fungi reproduce?

student_low_response: "I think it's binary fission."

teacher: How do Fungi reproduce?

student_medium_response: "Fungi reproduce through pollination, just like flowers and bees. They rely on the wind or insects to carry their pollen from one fungus to another, helping them create new offspring."

teacher: How do Fungi reproduce?

student_medium_response: "Pollination is an important process for fungi, where their spores are transferred from one mushroom to another, allowing them to reproduce and spread in different areas."

teacher: How do Fungi reproduce?

student_low_response: "Fungi use pollination to transfer their genetic material to other fungi, ensuring genetic diversity and the survival of their species."

teacher: How do Fungi reproduce?

student_low_response: "Fungi reproduce with binary fission, where they split into two identical halves, just like how cells divide during mitosis in our bodies."

teacher: How do Fungi reproduce?

student_low_response: "Binary fission is a cool way fungi reproduce because they can simply divide themselves in half to make new fungi, kinda like cutting a pizza into two equal slices."

teacher: How do Fungi reproduce?

student_low_response: "Fungi use binary fission as a method of reproduction by dividing their cells into two, creating two separate fungi that are genetically identical to each other."

teacher: How do Fungi reproduce?

student_low_response: "Fungi do not reproduce asexually."

teacher: How do Fungi reproduce?

student_low_response: "They don't reproduce."

teacher: How do Fungi reproduce?

student_high_response: "They are able to reproduce asexually by using spores."

teacher: How do Fungi reproduce?

student_medium_response: "They use spores, just like other plants use pollen."

teacher: How do Fungi reproduce?

student_high_response: "It's like pollen but they produce spores."

teacher: How can you graph a line?

student_high_response: "slope and y intercept."

teacher: How can you graph a line?

student_high_response: "use the, um, tables."

teacher: How can you graph a line?

student_high_response: "y intercept and X intercept."

teacher: How can you graph a line?

student_medium_response: "With one intercept, you can figure out the whole line because it shows where it touches the x-axis or y-axis!"

teacher: How can you graph a line?

student_low_response: "One intercept is like a secret code to unlock the whole line and draw it perfectly!"

teacher: How can you graph a line?

student_low_response: "If you know where the line crosses just one axis, you've got the key to drawing the whole line like a pro!"

teacher: How can you graph a line?

student_low_response: "Finding one intercept is enough, it's like a treasure map that leads you to the correct line without any extra work!"

teacher: How can you graph a line?

student_low_response: "You only need one point because that point is like the superhero that tells you everything about the line!"

teacher: How can you graph a line?

student_low_response: "If you put one point on the graph, it magically draws a line all by itself!"

teacher: How can you graph a line?

student_medium_response: "One point is enough because it's the special starting point for the line to follow!"

teacher: How can you graph a line?

student_low_response: "Using just one point is super easy and quick – you don't need to find more points to make the line!"

teacher: How can you graph a line?

student_low_response: "You can graph a line using a single point."

teacher: How can you graph a line?

student_low_response: "You can graph a line using a single intercept."

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "Three times three, minus four."

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_low_response: "Counting two of the sides with three and the other two with two?"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_low_response: "Also, there's the 'Jo's method' where instead of using nines you use twos."

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "To count them red squares in that 3x3 shape, you just gotta, like, count the sides, ya know? There are, like, 3 squares on each side, so that's $3+3=6$ squares!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "So, there are 3 rows and 3 columns, right? So you just gotta multiply 'em like 3 times 3 and, bam, you got 9 squares!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "You gotta look at the corners, and there are, like, 4 corners in a square, right? So there's 4 corners in each square and 3 squares in the red border, which makes $4+4+4=12$ squares, duh!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "You just count the boxes, man. Each little box is a

square, and there are, like, 9 boxes in the whole red border. So, yeah, 9 squares!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_low_response: "You just count the squares on one side and then do some math stuff. So, there's like 3 squares on one side, right? Then, you add 3 more because it's 3x3, and you get 6 squares in the red border!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "To find the squares in the red border of the 3x3 shape, we just count the boxes inside. So, there are 3 boxes in one row and 3 in another row, which makes it 6 squares, done!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "You just gotta count the corners of the red border squares. Each square has, like, 3 corners, right? So, there are 3 squares in the border, and 3 corners in each, that's $3+3+3 = 9$ squares!"

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_medium_response: "So, you look at the big squares and count them. There's, like, 3 big squares in the red border. But wait, each big square has 2 smaller squares in it, right? So, it's 3×2 which would be 6 squares."

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_high_response: "You can add up the squares along each side, except for the corners."

teacher: How would you tell how many squares were in the red border for a 3x3 shape?

student_high_response: "Just look at it as 4 sides, with the length of each side as how many squares there are."

teacher: What could make the tanker car implode?

student_low_response: "There was no space for the moisture to go so it just exploded."

teacher: What could make the tanker car implode?

student_low_response: "There's, like, ripples in there- I don't know, I don't know."

teacher: What could make the tanker car implode?

student_low_response: "I think the air would be sucked out of it, I think that's what
